Dimming

Multiple dimming functions are integrated (0-5V DC or 0-10V DC or PWM Signal or Timer).

† 0-5V Dimming

The recommended implementation of the dimming control is provided below.

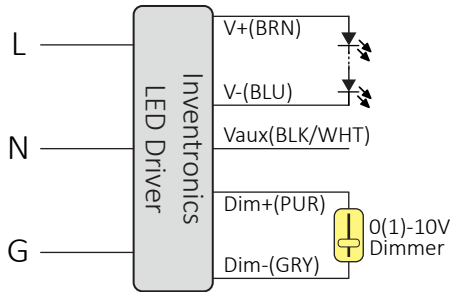

Notes:

1. The dimmer can also be replaced by an active 0-5V voltage source signal or passive components like resistors and zener.
2. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
3. If 0-5V dimming is not used, Dim + should be open.
4. When 0-5V negative logic dimming mode and Dim+ is open, the driver will output maximum current.

† 0-10V Dimming

The recommended implementation of the dimming control is provided below.

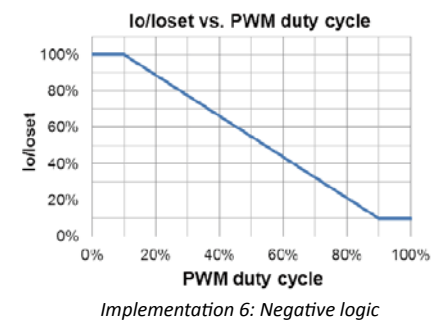

Notes:

1. The dimmer can also be replaced by an active 0-10V voltage source signal or passive components like resistors and zener.
2. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
3. If 0-10V dimming is not used, Dim + should be open.
4. When 0-10V negative logic dimming mode and Dim+ is open, the driver will output maximum current.

† PWM Dimming

The recommended implementation of the dimming control is provided below.

Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. If PWM dimming is not used, Dim + should be open.
3. When PWM negative logic dimming mode and Dim+ is open, the driver will output maximum current.

+ Time Dimming

(Setting Window)

Notes:

1. Time Dimming is required to program by computer (Microsoft Windows).
2. Set the timing curve by pulling the sliders.

Optical Control

Optical control function is supported by optional

If the fixture with OPTICAL CONTROL function, the Optical Receptacle will be installed on the cover of fixture. See **A**. Fit the pins of Optical Sensor to Optical Receptacle, firmly insert and rotate Optical Sensor to proper position.
